The Evolution of Statistical Computing

The R programming language

- R is an implementation of the S programming language inspired by Scheme.
- S was created by John Chambers while at Bell Labs in the 70's.
- Up to that time, much of the statistical computing was done by directly calling Fortran subroutines; however, S was designed to offer an alternate and more interactive approach.
- R was created by Ross Ihaka and Robert Gentleman at the University of Auckland, New Zealand.
- R is named partly after the first names of the first two R authors and partly as a play on the name of S.
- R is currently developed by the R Development Core Team, of which Chambers is a member.
- R is the top statistical language in the TIOBE index which is also above the commercial software SAS.
- R can be easily used in Big Data analysis platforms, e.g. Hadoop/Spark.

Installing R

Installing **R** on your own computer is simple and free.

- ① If you use Microsoft Windows, visit <http://www.r-project.org/>. It shipped with a simple graphical user interface (GUI).
- ② R is available for Mac OS X users with a nice build-in graphical user interface, visit <http://www.r-project.org>
- ③ If you use Linux, search the phrase “r-cran” in your system’s software repository. Any text editor can be used to edit R source code. But if you want a graphical user interface, **RStudio** (with is easy to install and also available for other platforms) is a good start. Please visit <http://www.rstudio.org/download/desktop>.
